Size differences among immunoglobulin heavy chains from phosphorylcholine-binding proteins.";

Proc. Natl. Acad. Sci. U.S.A. 73:2109-2112(1976).

INSCELLANBOUS: THIS CHIM WAS ISOLATED FROM AN IGA MYELOMA PROTEIN THAT BINDS PHOSPHORYLCHOLINE.

-!- SIMILARITY: Contains 1 immunoglobulin-like domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 4 WINNVFL--LTLLHGIQCEVKVVESGGGLVQPGGSLRLSCATSGFTFSDFYMEWVRQTPG

A27609
IG Heavy chain precursor V region (129) -
C,Species: Mus musculus (house mouse)
```

gamme

```
A; Introns: 138/1; 236/1; 258/1; 368/1
C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kapp hain disulfide bonds. In some cases, such as 198 and 198, the subunits associate into late; Superfamily: immunoglobulin C region; immunoglobulin homology C; Keywords: alternative splicing; duplication; glycoprotein; heterotetramer; immunoglobulin F; 573-227/Region: hinge F; 281-357/Romain: immunoglobulin homology <IM1>
                                                                                                                                                                                                                                                                                                                                                                                                         A; Molecule type: DNA
Molecule type: DNA
Molecule type: DNA
Molecule type: 13-189,'PP',193-300,'R',302-331,'A',333-437,'DI',440-474 <OLL>
